THE BRADFORD SLING

The Bradford Sling®

The Bradford Sling® has become synonymous with improving comfort for patients and reducing recovery times across a broad range of surgical procedures.

Used by healthcare professionals for over twenty years, the Bradford Sling® was originally designed and developed to meet heavy patient care requirements after tragic disasters such as the Bradford fire and Piper Alpha.

While originally designed to assist in the treatment of burns, the Bradford Sling® now embraces a wide variety of

post-procedural end-uses of differing levels of complexity. It has become the product of choice for healthcare professionals wishing to raise comfort levels and lower recuperation times for patients recovering from complex burns and other trauma.

Use is, however, by no means restricted to burns and plastic surgery and the product has a diverse range of applications. This flexibility allows healthcare professionals to use the sling in the most appropriate way to meet the needs of their patients from the perspectives of both medical and general wellbeing.
